

CHINESE NEW YEAR COOKIES FINAL PROJECT

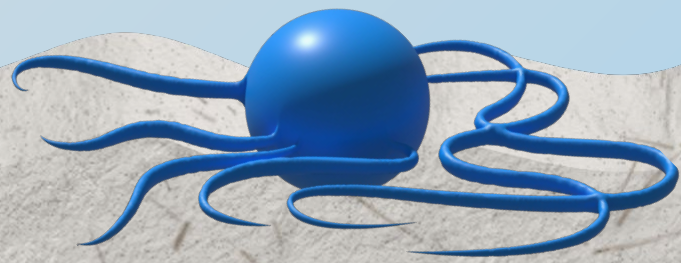

FUDI LIN, SHUXIAO GUO, RUIYANG ZHAO

01

MODELING

RUIYANG ZHAO

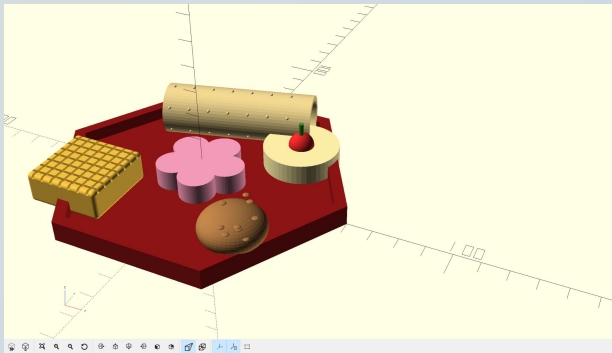

MODELING — RUIYANG ZHAO

WHAT WE DID

Created six parametric OpenSCAD modules using OpenSCAD scripting language: one plate plus five cookie types. Shared dimensions and LAYOUT_RADIUS kept scale and spacing consistent.

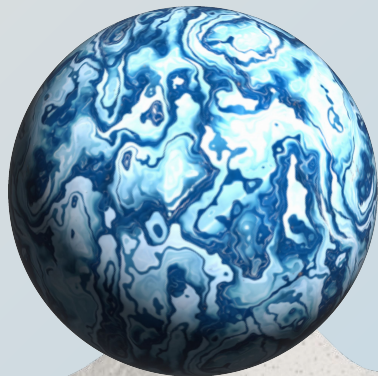

CHALLENGE

The model generated by AI was rough. The model's proportions were inconsistent and the cookies looked too blocky. We had to refine the geometry, dimensions, curves, and object placement step by step while keeping the OpenSCAD model editable.

02

TEXTURE

SHUXIAO GUO

TEXTURE — SHUXIAO GUO

WHAT WE DID

Assigned MeshStandardMaterial to each cookie. A procedural CanvasTexture creates the love-letter baking pattern and drives both bump and roughness maps.

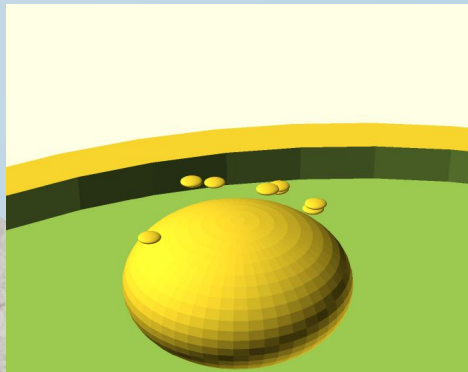

CHALLENGE

OpenSCAD has no normal bitmap-texture workflow, and modeling every surface mark as geometry would create too many polygons for real-time rendering.

RESULT

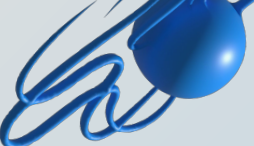

Clearer material contrast and visible surface variation without adding heavy geometry.

ANIMATION

FUDI LIN

ANIMATION — FUDI LIN

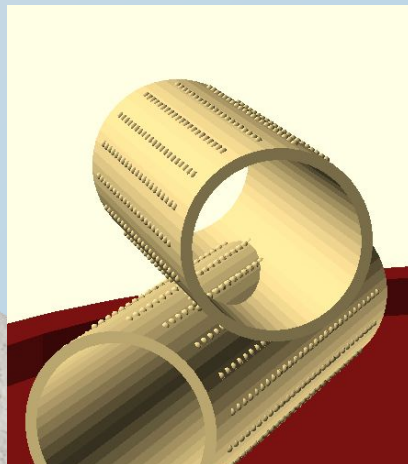

WHAT WE DID

Objects start 50 units below their target, enter at staggered delays, rise with easeOutBounce, then float slightly while the whole scene rotates.

CHALLENGE

Simultaneous motion looked crowded, and the egg roll needed extra lift to avoid clipping. Timing and target height had to be tuned per object.

FINAL INTERACTIVE SCENE

- Five cookie models on a red New Year plate
- Procedural bump detail + material contrast
- Soft lighting/shadows + bounce-in animation
- Drag / zoom / pan camera controls

THANK YOU
